Description

We are seeking a DevOps Engineer to support the design, automation, and maintenance of cloud infrastructure across AWS and Microsoft Azure environments. The role focuses on building CI/CD pipelines, automating deployments, monitoring cloud platforms, and ensuring secure, reliable, and scalable application delivery while collaborating with cross-functional teams.

Responsibilities

- Design, build, and maintain automated CI/CD pipelines using GitHub, Bitbucket, Azure DevOps, and EDP XL Release (XLR).
- Build, standardize, and support scalable cloud infrastructure and reusable components across AWS and Azure environments.
- Automate cloud infrastructure provisioning and maintenance while implementing DevOps best practices.
- Monitor application and infrastructure performance using Datadog and Dynatrace, and perform root cause analysis to resolve issues.
- Manage deployments, releases, incidents, and change requests using EDP GT, ServiceNow, and Jira.
- Develop cloud-native and serverless solutions, provide operational support for deployed systems, and collaborate with development teams to improve platform reliability and performance.

Qualifications

- Bachelor’s degree in Computer Science, Information Technology, Software Engineering, or a related field.
- Professional experience is not mandatory; a willingness to learn and grow in a DevOps environment is essential.
